

Streaming Solutions **Streaming is a technique for transferring data so it can be processed as a steady and continuous stream. Streaming technologies are becoming increasingly important with the growth of the Internet because most users do not have fast enough access to download large multimedia files quickly. With streaming, the client browser or plug-in can start displaying the data before the entire file has been transmitted.** Here is a useful video about Streaming Solutions:

<http://www.youtube.com/watch?v=mri7cha8ziw>

For streaming to work, the client side receiving the data must be able to collect the data and send it as a steady stream to the application that is processing and converting the data to sound or pictures. This means that if the streaming client receives the data more quickly than required, it saves the excess data in a buffer. However, if the data does not come quickly enough the presentation of the data will not be smooth. When the client requires this service, we will ensure that the streaming data is set up in the most **efficient and easily accesbile** way possible.
